

AD Module

Modbus RTU protocol, 24V DC.

The address for each module can be set using DIP switch.

Features and Specifications

Software Protocol: Modbus RTU protocol

Operating Voltage: 24V DC (can be changed to 6.5V-12V);

Measuring range: $\pm 15mV$

A/D Resolution: 1000000

Temperature coefficient: 5ppm/ (typical)

Hardware Interface: RS-485 interface, half-duplex.

Dimensions(mm) Rectangle: 86x55x18

A/D conversion, digital calibration, tare, zero setting/tracking, switch-on zero setting, anti-dithering;

All the parameters can be set through serial interface;

Module addresses are available from 0 to 31. Modules can work through bus communication;

Baud rate, parity bit and data output format can be set. 1200-38400bps;

Digital filtering: standard filtering or LPF;

Sampling speed: 3.125-400Hz;

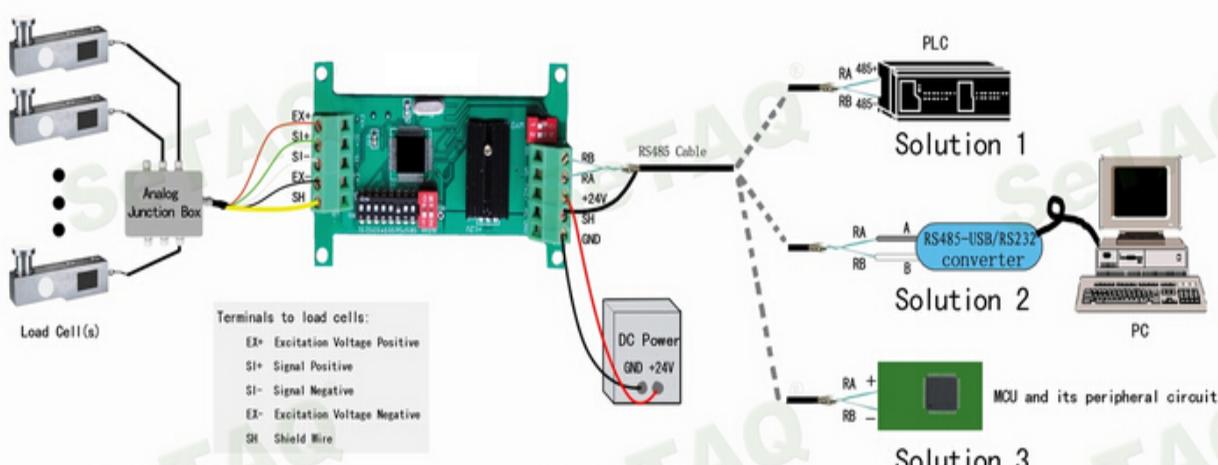

Storage of the parameters with protection against power failure;

Operating Current: less than 40mA;

Complete protection: wrong wiring protection, overvoltage protection, transient voltage suppression;

Operating temperature range: -40--+70; Storage temperature range: -60--+90

Wiring Diagram

Each load cell in the above diagram has 4-wire with a shielded wire. If the load cell has 6-wire with a shielded wire, please shortcircuit feedback wire FB+ with excitation voltage wire Ex+ and FB- with Ex- separately.
